

SecureMove-TLC™

Confidence in Safety & Mobility

Reduce Tube/Line/Cord Hazards & Events

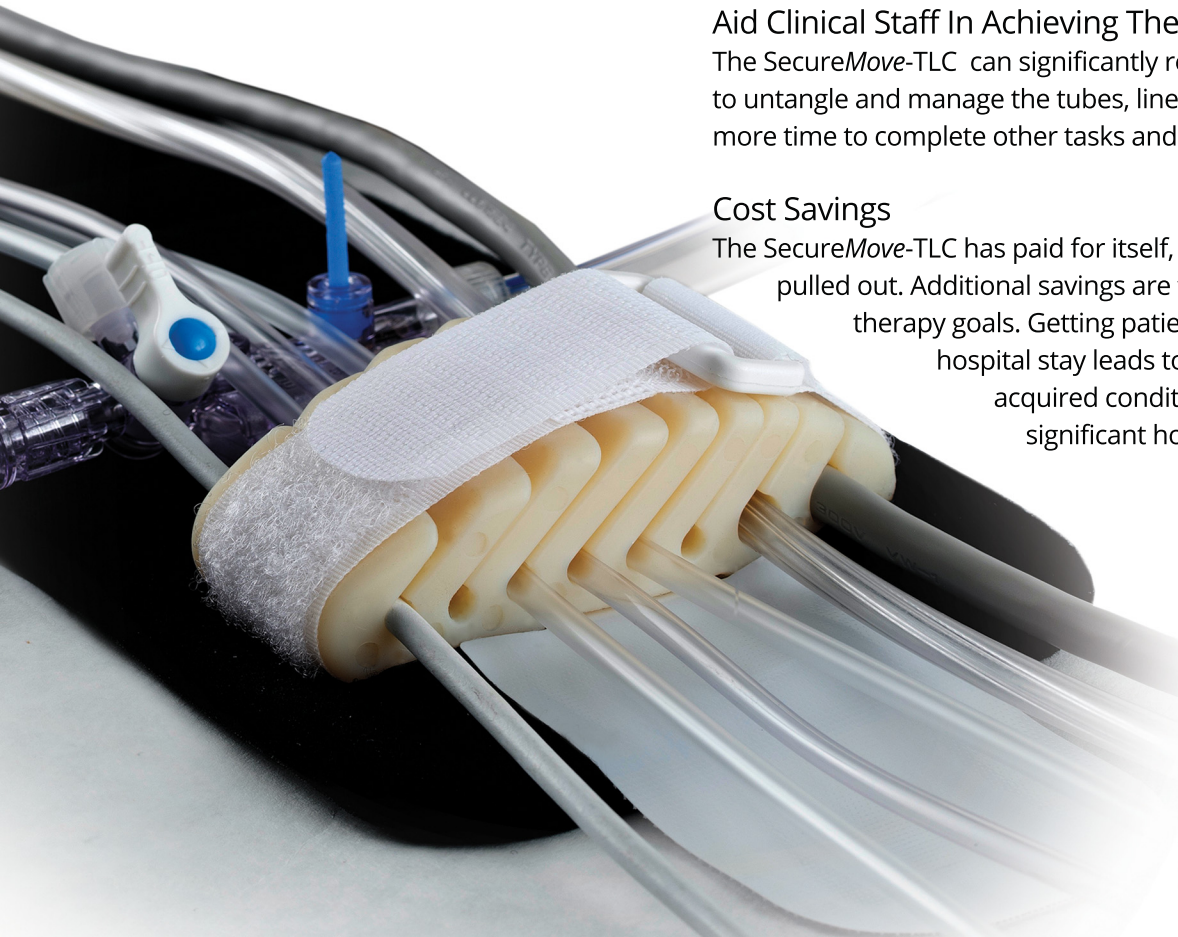

The SecureMove-TLC is a wearable, single-use medical device designed to secure and organize different types of medical tubes, lines, and cords to support patient therapy efficiency and improve IV medication safety. The patent-pending tension mitigation device is designed to eliminate hazardous pulling and line/cord dislodgement during therapy, transport, and patient movement.

Aid Clinical Staff In Achieving Therapy Goals

The SecureMove-TLC can significantly reduce the staff time required to untangle and manage the tubes, lines, and cords, giving clinicians more time to complete other tasks and attend to their patients.

Cost Savings

The SecureMove-TLC has paid for itself, if it prevents one line from being pulled out. Additional savings are tied to benefits of meeting patient therapy goals. Getting patients up and moving during their hospital stay leads to earlier discharge, fewer hospital acquired conditions, fewer readmissions, and significant hospital savings, up to \$3.7M a year (per Johns Hopkins research).

Compromised Catheters

Prevents Painful Line Pulling & Dislodgement

Prevents painful line pulling and dislodgement at insertion sites. If a pull force occurs (line becomes tugged or yanked), the pull force is mitigated at the device, leaving the patient's insertion site unaffected.

Tension Mitigation for Tubes, IV Lines, & Cords

Mitigates line pulls up to 40 pounds. Central venous catheters can pull out with as little 9 lbs of pull force.

Secures Multiple Tubes, IV Lines, & Cords

Secures and organizes up to 8 lines of varying sizes with one SecureMove.

Transfers Easily From Patient Arm to IV Pole

Can be easily transferred from patient arm to IV pole for versatility in patient mobility, transport, and daily care.

Secures & Organizes Lines For Patient Mobility & Transport

The SecureMove aids in reducing the amount of time it takes to untangle, organize, and secure patient lines for patient movement, therapy and transport.

Skin Biocompatible, Non-irritating, No Adhesives

Made with all USP Class VI medical grade, skin biocompatible materials. Flexible and soft on skin. No adhesives.

Single Patient Use

Can be worn for up to 30 days. Device can travel with patient.

Accommodates Multiple Transducers

Up to three transducers can be added to the SecureMove for optimal monitoring.
